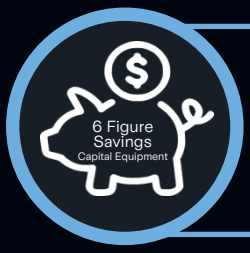
# CASE STUDY

## HOW A CUSTOMER USED COHERIX PRIMERMASTER™ TO OPTIMIZE THEIR PRODUCTION

One of the largest glassmakers in North America was utilizing three people per shift per line to manually locate the glass and verify primer was applied for a high-volume program.

The manufacturer realized the benefit and installed Coherix PrimerMaster with LocationMaster to their primer dispensing line.



LocationMaster ensures the glass is precisely located before dispensing primer, driving six figure savings in initial capital equipment investment of mechanical fixtures.

Coherix PrimerMaster detects gaps and verifies the proper location and width of the primer, preventing downstream contamination

Coherix hardware and process control solutions allowed the glassmaker to move the three people per shift to other areas of the plant, providing over a million dollars in labor savings over the course of the program.
